

Research Method of Data Science

Week 5: Qualitative Research and Research Design

Igor Vyshnevskyi, Ph.D.

Sogang University

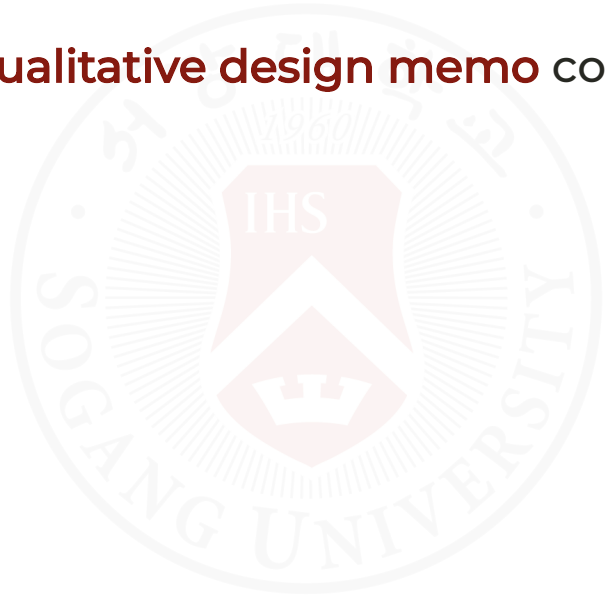

September 29/October 1, 2026

Week 5: Qualitative research

Tuesday, September 29: understanding and choosing an approach

Thursday, October 1: designing and practicing a small study

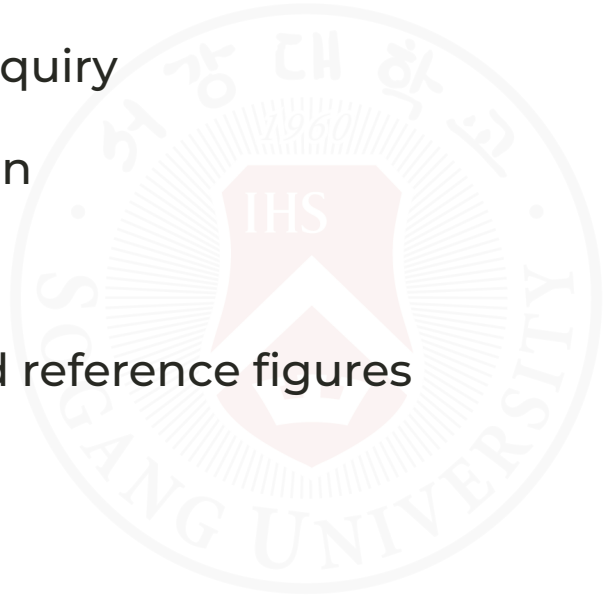

This week's output: an individual **qualitative design memo** connected to your final research project.

Agenda

Tuesday · Meeting 1

1. Qualitative questions, assumptions, and collection methods
 2. Five approaches to qualitative inquiry
 3. Choosing and defending a design
 4. Preparation for Thursday
- Appendix: published examples and reference figures

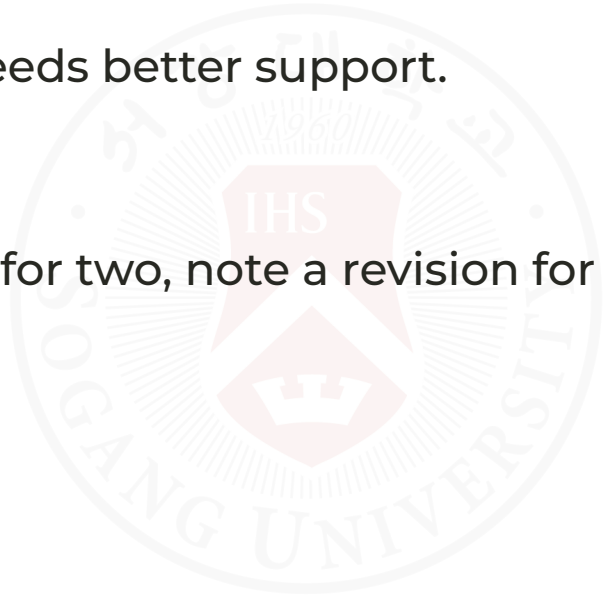

Week 4 connection: peer feedback

Exchange your literature-review draft with a partner.

- Identify one clear comparison between sources.
- Identify one claim or gap that needs better support.
- Suggest one specific revision.

Five minutes: read for two, discuss for two, note a revision for one.

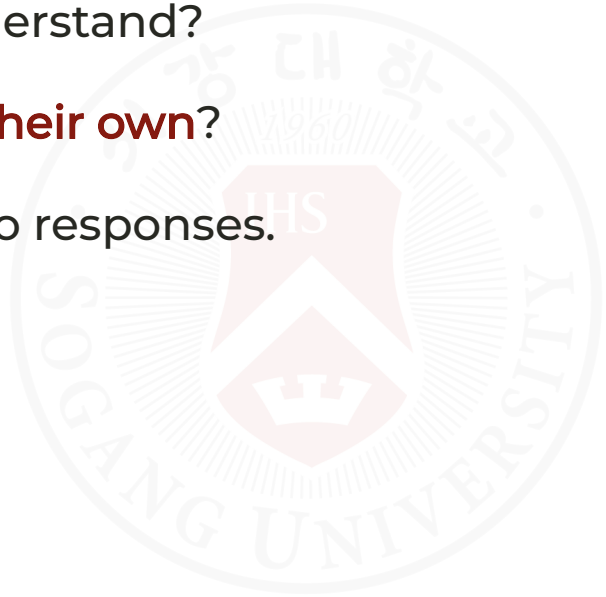

A result leaves a question

Fictional example: a survey finds that frequent AI users report lower confidence in their reasoning.

What could interviews help us understand?

What could they **not establish on their own**?

Think for 30 seconds, then hear two responses.

The seal of Gwangju University is a circular emblem. It features a central shield with a crown on top and the letters 'IHS' inside. Above the shield is the year '1960'. The shield is surrounded by a circular border containing the university's name in Korean and English, and the founding year '1960' at the top.

1. Qualitative questions, assumptions, and collection methods

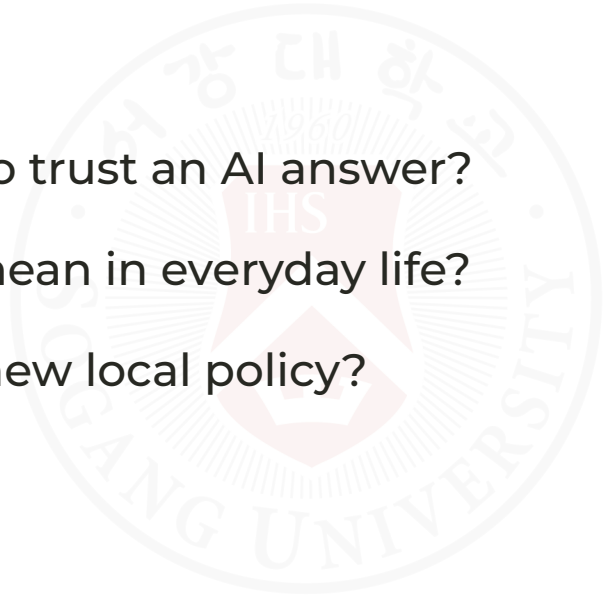

Questions about meaning, experience, and process

Qualitative research examines how people understand and act within particular contexts.

Evidence may include interviews, observations, documents, images, and interactions.

Examples:

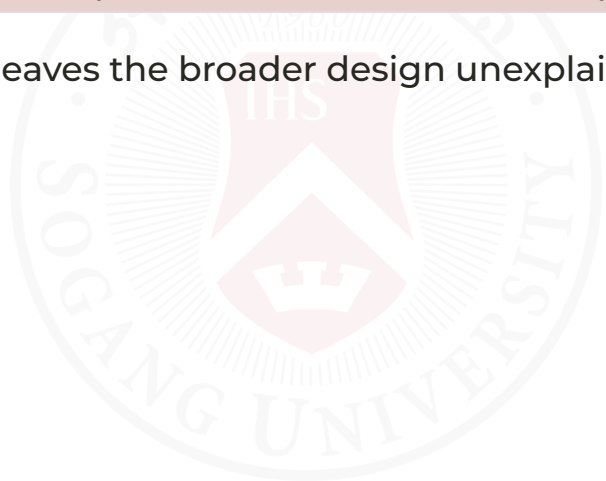

- How do students decide when to trust an AI answer?
- What does financial insecurity mean in everyday life?
- How do residents experience a new local policy?

Question, approach, method, and analysis

Decision	Example
Research question	How does a student group negotiate acceptable AI use?
Approach	A bounded case study of that group
Data collection	Interviews, meeting observations, and policy documents
Analysis	Compare accounts, practices, and documents for patterns

“Conduct interviews” describes a method, but leaves the broader design unexplained.

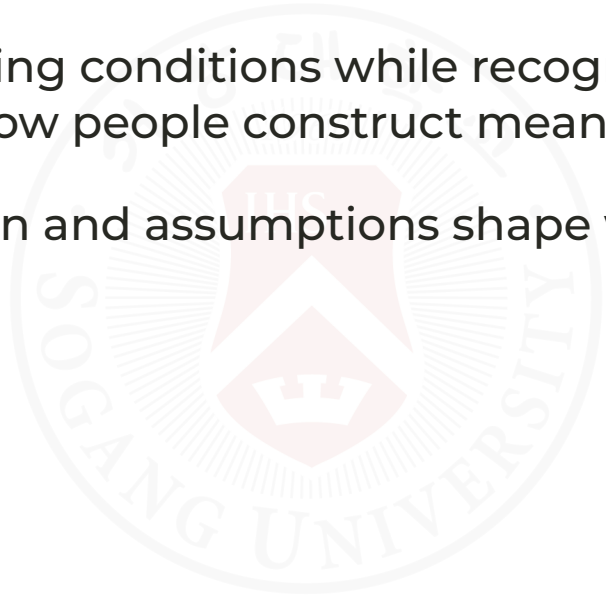

Assumptions influence interpretation

Ontology: What do we assume exists in the social world?

Epistemology: What can count as knowledge about it?

A critical realist may study underlying conditions while recognizing that accounts are partial. An interpretivist may emphasize how people construct meanings in context.

Reflexivity: How might your position and assumptions shape what you ask, notice, and conclude?

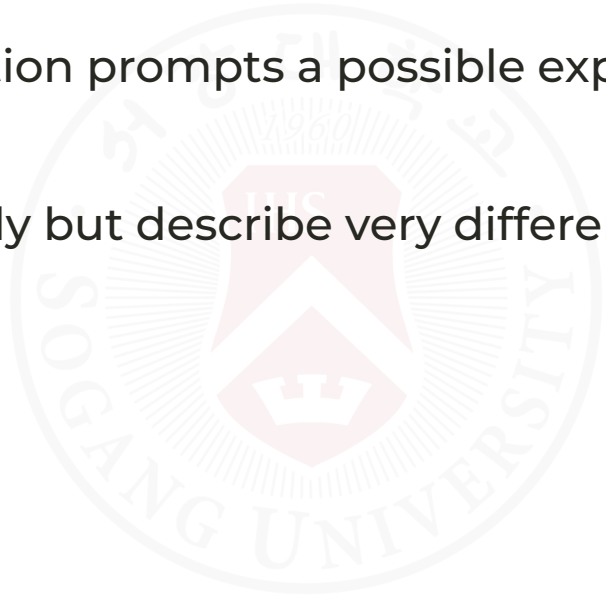

Reasoning can move in several directions

- **Induction:** recurring observations suggest a pattern.
- **Deduction:** an existing explanation guides what you examine.
- **Abduction:** a surprising observation prompts a possible explanation that you investigate further.

Example: students use AI frequently but describe very different learning practices.

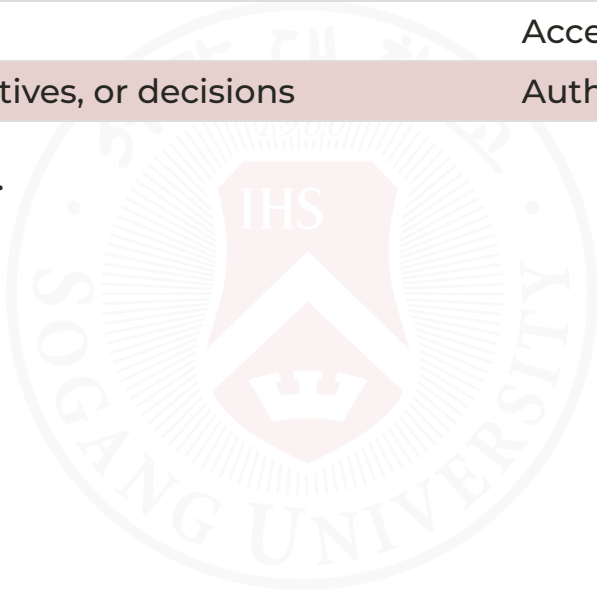

What would you ask next?

Choosing a way to collect evidence

Method	Useful when you need...	Design issue
Interview	An individual account	Recall and interviewer influence
Focus group	Interaction around a shared issue	Dominant voices and confidentiality
Observation	Practices in a setting	Access and observer influence
Document analysis	Recorded rules, narratives, or decisions	Authorship, purpose, and missing voices

Choose evidence that can answer the question.

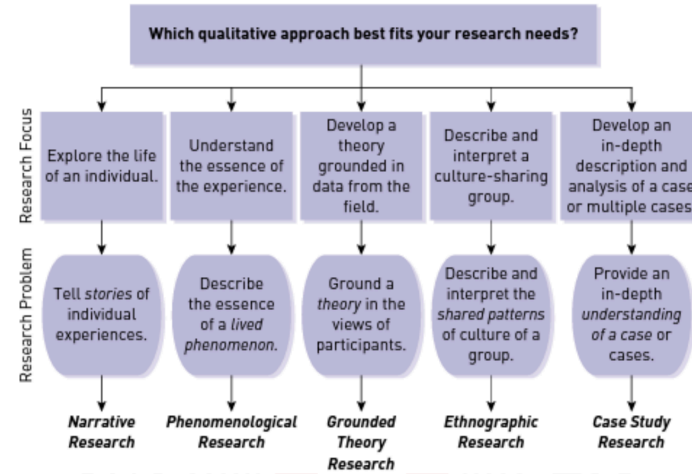

The seal of Gangneung University is a circular emblem. It features a central shield with a crown on top and the letters 'IHS' inside. The year '1960' is inscribed above the shield. The outer ring of the seal contains the university's name in Korean and English.

2. Five approaches to qualitative inquiry

Five approaches: different research purposes

FIGURE 4.1 • A Flowchart for Assessing Fit of Five Qualitative Approaches With Various Research Needs

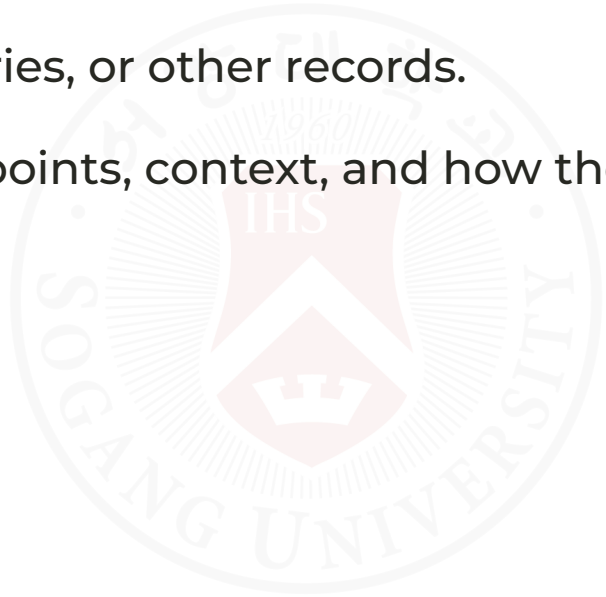

Narrative inquiry: a story over time

Focus: how a person or people tell and make sense of experiences over time.

Example question: How does an entrepreneur narrate failure and a later return to business?

Evidence: repeated interviews, diaries, or other records.

Interpretation: sequence, turning points, context, and how the story is told.

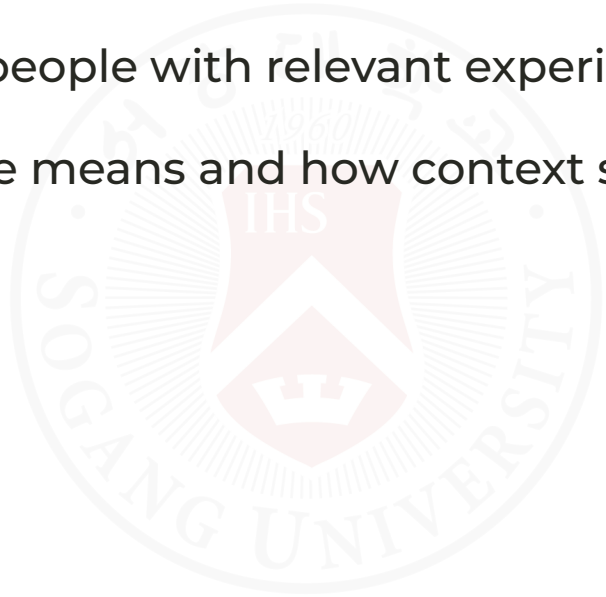

Phenomenology: lived experience

Focus: the meaning of a shared experience for people who have lived it.

Example question: What is it like to become a father while still an adolescent?

Evidence: detailed accounts from people with relevant experience.

Interpretation: what the experience means and how context shapes it.

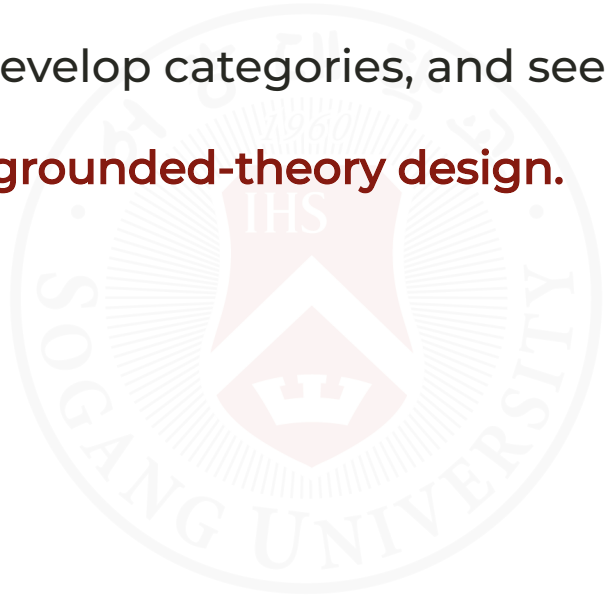

Grounded theory: developing an explanation

Focus: generate an explanatory account of a process through iterative analysis.

Example question: How do students develop a leadership identity?

Collect evidence, compare cases, develop categories, and seek further evidence to refine them.

Coding alone does not establish a grounded-theory design.

Ethnography: shared practices in context

Focus: everyday practices, meanings, and relationships within a group or setting.

Example question: How does a student society develop informal rules about AI use?

Evidence: sustained engagement, observation, fieldnotes, interviews, and artifacts.

A single brief visit usually cannot support a claim to a full ethnography.

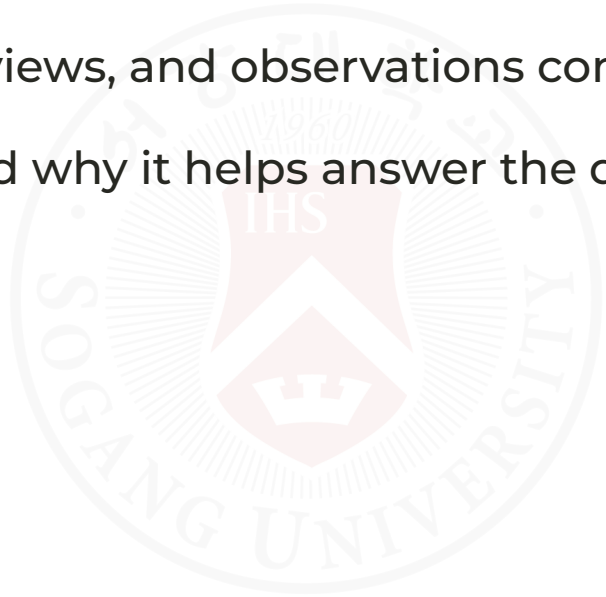

Case study: a bounded case in context

Focus: an in-depth investigation of a clearly defined case.

Example: one university's implementation of an AI policy during one semester.

Evidence: policy documents, interviews, and observations considered together.

Define the case, its boundaries, and why it helps answer the question.

Pair challenge: same topic, different designs

Topic: adapting to university life.

Assign an approach to each question:

1. How does one student's account of belonging change over time?
2. What is the lived experience of feeling excluded?
3. How do students move from avoiding help to seeking it?
4. What informal practices shape belonging in one student society?
5. How did one university implement its mentoring program?

For one question, name the evidence you would need.

The background of the slide features a large, faint, circular seal of Gwangju University. The seal contains the university's name in Korean and English, the year 1960, and the letters IHS.

3. Choosing and defending a design

Design clinic: your own research question

Individually · 5 minutes

Write:

1. One question qualitative evidence could help answer
2. The approach that best fits and why
3. Who, what, or which case you would study
4. One claim your proposed evidence could not support

You may explore a related question even if your final project remains quantitative.

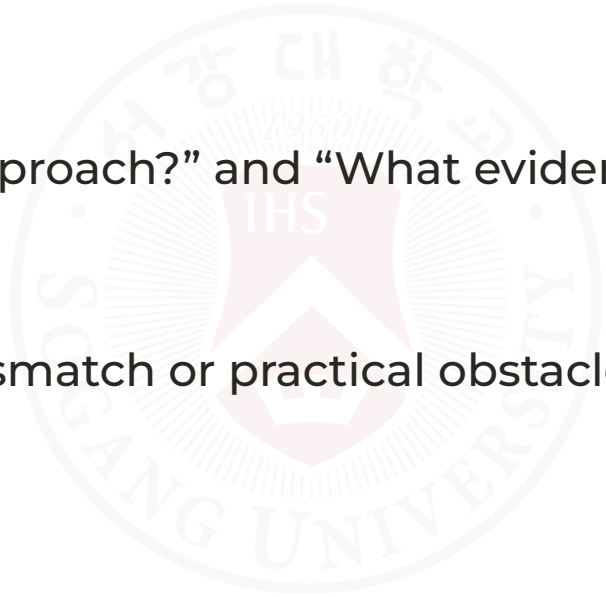

Triad challenge: defend and improve

Four groups of three · 9 minutes

Each student has three minutes:

- 1 minute: explain the design
- 1 minute: peers ask “Why this approach?” and “What evidence?”
- 1 minute: revise one decision

Peers should identify a specific mismatch or practical obstacle.

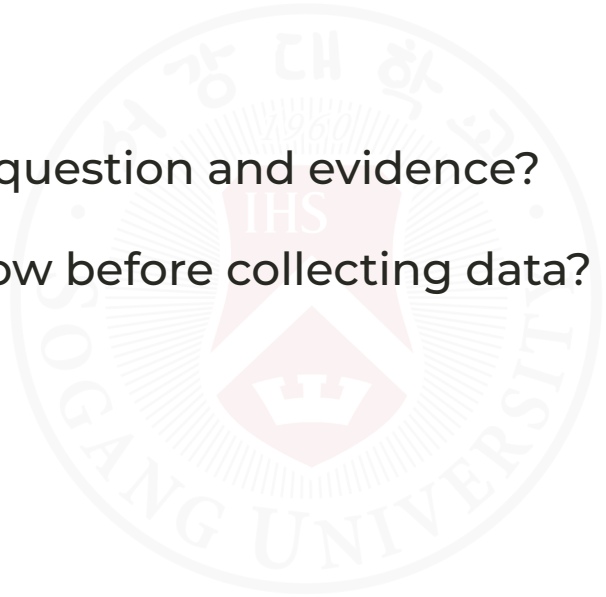

Whole-class comparison

Six minutes

Two groups each share one design decision and the revision it prompted.

Class response:

- What improved the fit between question and evidence?
- What would you still need to know before collecting data?

4. Preparation for Thursday

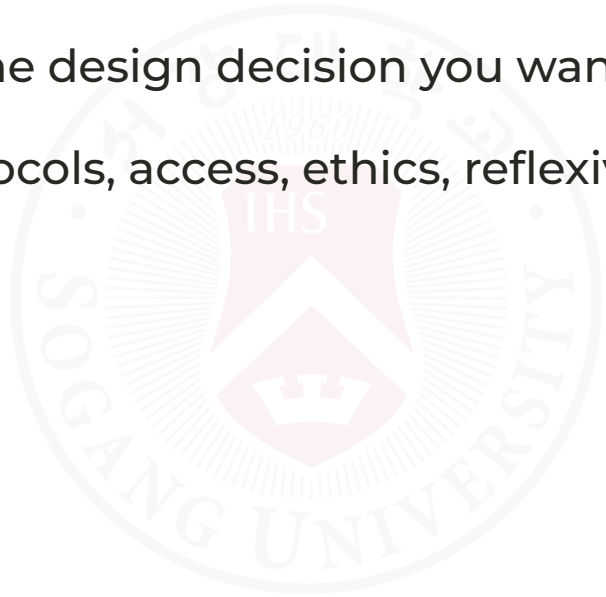

Your preparation

Bring your question and today's design sketch.

Choose **one published example** from the gallery to inspect before Thursday.

Note its question, evidence, and one design decision you want explained.

Thursday will cover sampling, protocols, access, ethics, reflexivity, and interview practice.

What qualitative evidence could add

Finish this sentence aloud with your partner:

| “My current evidence may show __. Qualitative evidence could help me understand __.”

Next meeting: turn that possibility into a feasible design.

The seal of Hanyang University is a circular emblem. It features a central shield with a crown on top and the letters 'IHS' inside. The year '1960' is inscribed above the shield. The outer ring of the seal contains the university's name in Korean and English.

Meeting 2: Qualitative design studio

Agenda

Thursday · Meeting 2

1. Reading a published research design
2. Sampling, protocols, access, and ethics
3. Interview practice and feedback
4. Individual design memo
5. Next week: coding and interpretation

Retrieval: what makes this a design?

“I will interview five students about AI.”

With a partner, identify **two missing decisions**.

Then improve the statement without inventing a result.

The seal of Chung-Ang University is a circular emblem. It features a central shield with a crown on top and the letters 'IHS' inside. The year '1960' is inscribed above the shield. The outer ring of the seal contains the university's name in Korean and English.

1. Reading a published research design

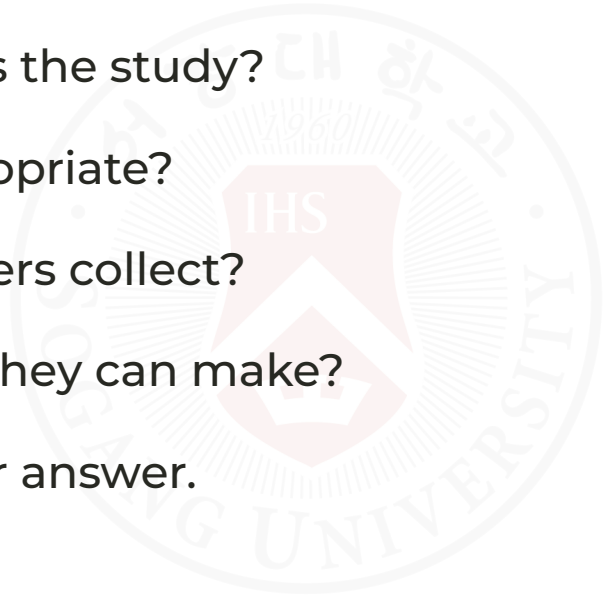

Article investigation: six pairs

Use your assigned example in the **published-example gallery**.

Record four items:

1. What question or purpose drives the study?
2. What makes the approach appropriate?
3. What evidence did the researchers collect?
4. What is one limit on the claims they can make?

Point to a passage supporting your answer.

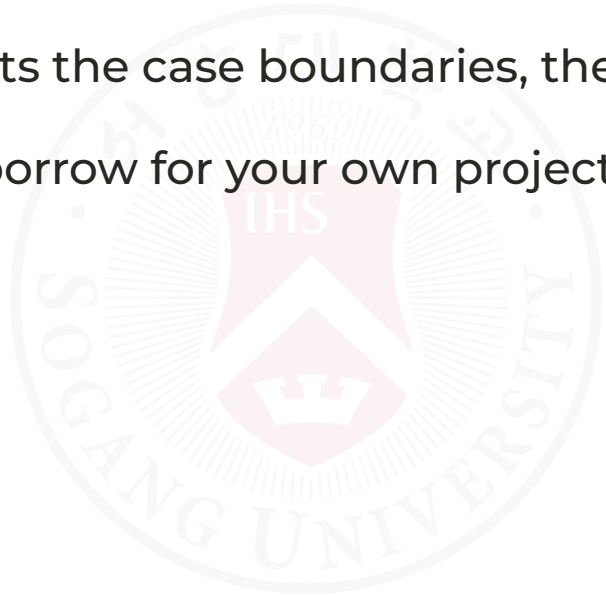

Reports: evidence before labels

Each pair has **one minute** to explain:

| “We identify this design because the researchers __, as shown in __.”

For the case-study pairs: one reports the case boundaries, the other the evidence and analysis.

Which design decision could you borrow for your own project?

2. Sampling, protocols, access, and ethics

Sampling follows the question

Purposive sampling: select people, documents, or cases because they can inform the question.

Possible reasons: relevant experience, contrasting situations, or a critical case.

Ask: **Who or what would my easiest sample miss?**

There is no universal qualitative sample size. Scope, diversity, evidence quality, and the approach matter.

A protocol makes collection consistent

A **protocol** is a short plan for how you will collect evidence.

Include:

- the purpose, selection criteria, and access arrangements;
- an opening explanation and consent procedure;
- core questions or observation/document prompts;
- recording, note-taking, storage, and closing procedures.

Quick check: What would change for document analysis?

Ethics is part of the design

Before collecting participant data, clarify:

- voluntary, informed participation and the ability to skip questions;
- permission for recording and use of quotations;
- what you will store, who can access it, and when it will be deleted;
- limits to anonymity, especially in a small class or group;
- instructor approval and applicable institutional review requirements.

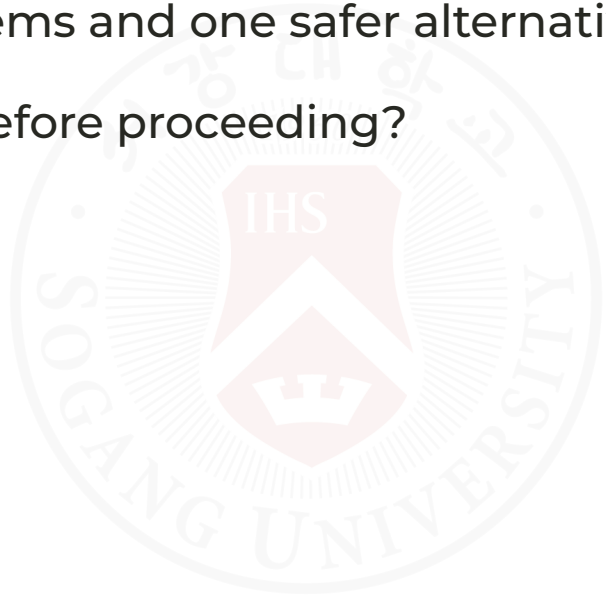

Do not upload identifiable material to public repositories or AI services.

Ethics decision: a class group chat

A student wants to screenshot a private class chat to study stress. They plan to remove names and upload it to an AI tool for coding.

Pairs · 1 minute: identify two problems and one safer alternative.

What would you need to resolve before proceeding?

3. Interview practice and feedback

Questions that invite an account

Leading: “Why does AI make students lazy?”

Open: “Can you describe a recent task where you considered using AI?”

Possible probes:

- “What happened next?”
- “What influenced that decision?”
- “Can you give an example?”

Ask one question at a time and allow silence.

Practice in four groups of three

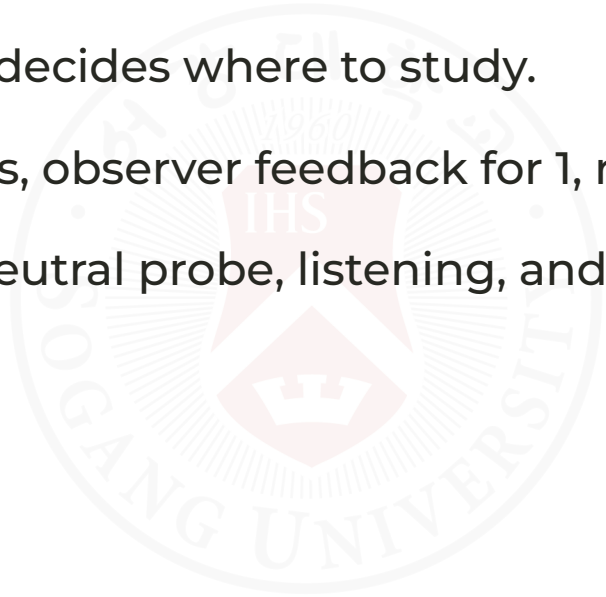

12 minutes · three rounds of four minutes

Rotate: **interviewer, participant, observer.**

Safe topic: how a fictional student decides where to study.

Each round: interview for 2 minutes, observer feedback for 1, revise and rotate for 1.

Observer checks: open question, neutral probe, listening, and an unsupported assumption.

Debrief: what changed the answer?

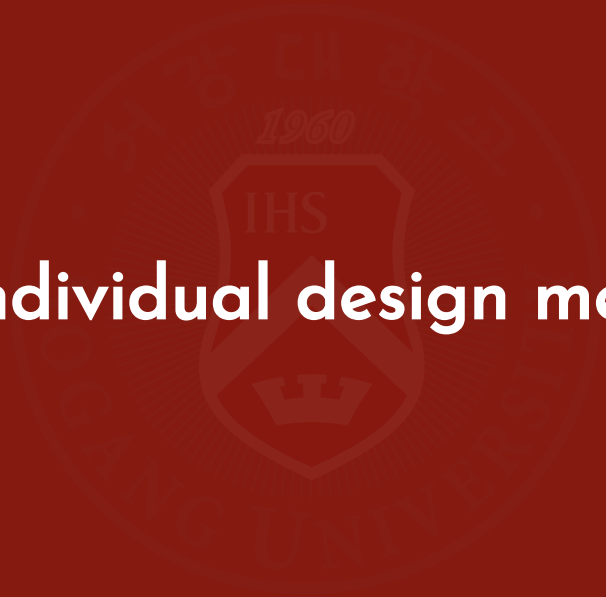

Name one question that opened up a useful account.

Name one assumption the interviewer had to reconsider.

Reflexivity note: “My wording or position may have influenced ____.”

4. Individual design memo

Your memo: a feasible qualitative design

Write individually · 8 minutes · about 200–300 words

Include:

1. Question and connection to your final research project
2. Approach and a reason it fits
3. Participants, documents, or case, with selection and access plan
4. Three open questions or document/observation prompts
5. Ethics, one limitation, and one reflexive consideration

A justified document-based design is welcome.

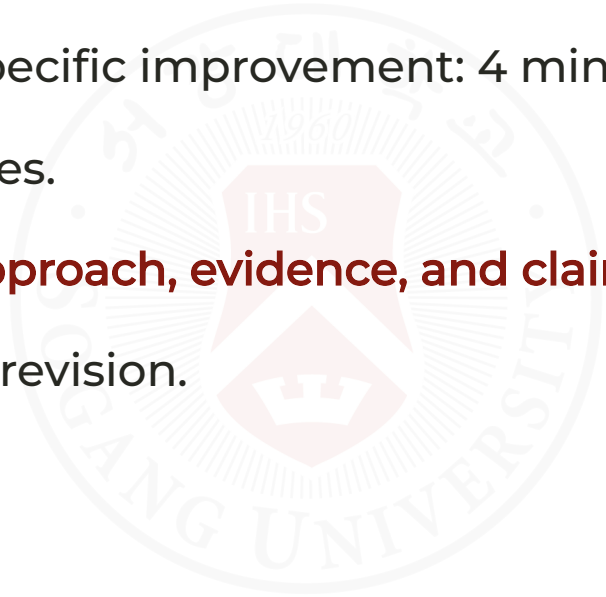

Peer review and revision

Six pairs · 10 minutes

- Read your partner's memo: 3 minutes.
- Discuss one strength and one specific improvement: 4 minutes.
- Revise your own memo: 3 minutes.

Check the fit between **question, approach, evidence, and claim**.

Add one sentence explaining your revision.

5. Submission and next week

Submission and feedback criteria

Upload your **individual memo** to Cyber Campus.

Due: Thursday, October 1, 2026, 14:45

Maximum: 10 points

Next week: coding and interpretation

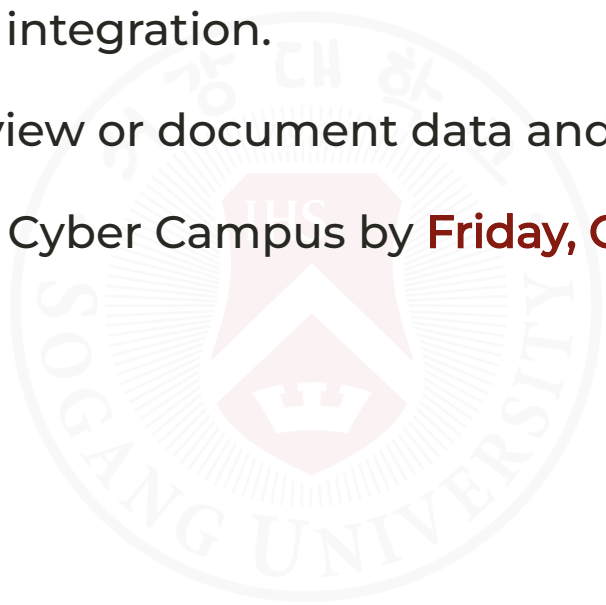

Bring your design memo and its three collection prompts.

Tuesday: transcription, coding, categories, themes, interpretation, trustworthiness, triangulation, and mixed-methods integration.

Thursday: a coding lab using interview or document data and the qualitative research exercise.

The next reading will be posted on Cyber Campus by **Friday, October 2.**

Questions?

The background of the slide features a large, faint, circular seal of Gwangju University. The seal contains the university's name in Korean and English, the year 1960, and the letters IHS.

Entrepreneurial failure stigma
Narrative approach
Microprocesses
Epiphanies

ABSTRACT

This paper implements a qualitative, narrative approach to investigate entrepreneurs' personal experience of stigma associated with venture failure. Findings draw on the lived experience of 12 entrepreneurs and tell a collective story of how stigma affects entrepreneurs, shapes their actions, and engenders outcomes for them and their ventures. The story covers three episodes of entrepreneurs anticipating, meeting, and then transforming venture failure. Overall the paper shifts the focus of stigma research from the socio-cultural perspective pervading research to date, to micro-level processes underlying socio-cultural trends. Findings offer unexpected insights into failure stigmatization. First, findings suggest stigmatization is best viewed as a process that unfolds over time rather than a label. Second, this process begins before, not after, failure and contributes to venture demise. Third, there is a positive ending to the collective story in that stigmatization ultimately triggers epiphanies or deep personal insights which transform entrepreneurs' view of failure from a very negative to a positive life experience. This transformation results in entrepreneurs distributing learning from failure to the founding of future ventures, even when ventures are not their own.

Narrative: research purpose

Research purpose:

To date, research predominantly examines stigma due to entrepreneurial failure at the societal level. Empirical findings reveal socio-cultural stigma in specific countries and show its relationship to outcomes such as interest in entrepreneurship (Begley and Tan, 2001) and entrepreneurial risk taking (Damaraju et al., 2001). Taken collectively, this quantitative research reveals generalizable relationships characteristic of the wider social context within which failed entrepreneurs make decisions about future entrepreneurial endeavors. However, we know little about the micro-level mechanisms and processes underlying these societal level relationships. Researchers have yet to explore how social stigmatization affects individual entrepreneurs' actions, behaviors, and decisions during and after venture failure. Moreover, self-stigmatization may shape failing entrepreneurs' actions, in addition to social stigmatization, since venture founders intertwine their identities with venture outcomes (Cardon et al., 2005) and see their businesses as extensions of themselves (Shepherd et al., 2009).

The purpose of this paper is to empirically explore the stigma of entrepreneurial failure at the individual level. In particular, we seek to understand failure stigmatization from the perspective of entrepreneurs who have experienced it and to illuminate how and why stigma affects entrepreneurs and their actions and decisions. We thus address the research question "How does stigmatization affect entrepreneurs and shape their actions as ventures fail?" We implement a qualitative, narrative approach to examine the question. Narrative organizes and gives meaning to narrators' experience of events (Creswell, 2007; Elliot, 2005) and meaning making can be a core driver of the entrepreneurial process (Garud and Giuliani, 2013). Importantly, narrative illuminates mechanisms underlying generalized relationships surfaced through quantitative research (Elliot, 2005). It can show how individual agency coalesces over time to give rise to the macro-level relationships surfaced through quantitative research (Garud and Giuliani, 2013). Narrative also illuminates process and change over time and may reveal epiphanies that potentially alter the fabric of individuals' lives in ways that are unexpected (Denzin, 1989). A narrative approach to entrepreneurship research is on the rise and is particularly good at revealing how entrepreneurs generate and modify their vision of the future (Gartner, 2007). All told, narrative research on failure stigmatization can enhance our understanding of how and why stigma affects entrepreneurs and their subsequent decisions about future start-ups. It can also extend our understanding of the distribution of learning from failure that accompanies these start-ups. In the following sections, we present a background to the study, describe research methods, present findings, and discuss implications for the wider entrepreneurship literature.

Narrative: methodology

of entrepreneurs that undergird failure stigmatization patterns at the socio-cultural level identified in existing quantitative research. Within this broader qualitative design, we implemented a narrative approach consistent with a growing body of research in sociology (Elliot, 2005) and psychology (Creswell, 2007; Lieblich et al., 1998). Narrative is discourse that provides a clear sequential order which connects events in a meaningful way, thereby offering insights about peoples' experiences (Hinchman and Hinchman, 1997). It is a device of interpretation through which people make sense of themselves and their experiences and can contain accounts of transformation (change over time), some kind of 'action' and characters, all of which are brought together in an overall 'plot' (Lawler, 2002, p. 242). Narratives are somewhat unique within qualitative methods given they contain temporal information about when and why certain events unfold and the effects of these events on subsequent happenings (Polkinghorne, 2003). It thus can illuminate factors proximal to outcomes (Elliot, 2005); outcomes being the founding of new ventures and the implementation of learning by failed en-

We employed what Patton (1990) labels purposive sampling by selecting information-rich examples to study. These were in depth examples likely to yield substantive information about the topic under investigation. In particular, the sample consisted of 12 entrepreneurs who experienced venture failure and its associated stigmatization and told richly detailed stories of this experience. We identified these entrepreneurs in two ways. First, we used a business school newsletter to disseminate information about the research and invite entrepreneurs with failed ventures to participate. Researcher contact details were provided in the newsletter.

Data were collected in 2009 predominantly through interviews which lasted between 1.5 and 2 h. Interviews are the typical method used for data collection in narrative research; often the sole source of data (Creswell, 2007; Elliot, 2005; Lieblich et al., 1998). Our interviews were semi-structured with open ended questions asking participants to tell the interviewer their story of venture failure. Other data were collected as background information and played a secondary role to the interview data which constituted the primary evidence analyzed in the study (Creswell, 2007). Background data included media articles and website

4.3. Data analysis

We began by constructing chronologies for each entrepreneur's story of venture failure, looking for common elements (Creswell, 2007; Elliot, 2005). As such, evidence revealed a collective story of failed entrepreneurship and how stigmas were experienced as participants moved through the sequence of events that constituted failure and its aftermath. We then conducted what is normally called content analysis of interview data, a classical method of analyzing narrative evidence in psychology, sociology, and education (Lieblich et al., 1998; Manning and Cullum-Swan, 1994). Content analysis involves identifying important themes and patterns in the data (Patton, 1987) and has been used in qualitative research on entrepreneurial failure (Cope et al., 2004).

POPULATIONS AT RISK ACROSS THE LIFESPAN: CASE REPORTS

A Qualitative Study of the Meaning of Fatherhood Among Young Urban Fathers

Celeste A. Lemay, Suzanne B. Cashman, Dianne S. Elfenbein, and Marianne E. Felice

ABSTRACT *Objective:* To explore the beliefs, attitudes, and needs young men have regarding their role as a father. *Design and Sample:* Exploratory, descriptive, qualitative design. Young fathers/young expectant fathers were recruited from service sites within a city in Massachusetts. Men were considered young fathers/young expectant fathers if they were or would be <20 years old at the birth of a first child or the mother of their baby was or would be <20 years old at the baby's birth and the young man was <25 years old. *Measures:* Participants were interviewed utilizing open-ended questions, which included the following: the characteristics of good fathers, goals/needs for self and child, and whether or not they planned to raise the child as their father raised them and why. *Results:* Responses regarding fathering clustered into the following themes: being available; providing support; and self-improvement, including completing education and becoming a positive role model. Forty-seven percent believed that being employed or finishing school would help them be better fathers; 77% reported they would not raise their child as their own father had raised them, citing physical and/or emotional abuse/abandonment. *Conclusions:* Young men in this study identified several challenges to being "good" fathers. These included lack of employment, education, and positive role models.

Key words: adolescent fatherhood, adolescent pregnancy, attitudes, beliefs.

Phenomenology: interview questions

TABLE 1. *Individual Interview Guide Questions*

-
1. What do you think makes a man a good father? What characteristics would a man who is a good father have?
 2. Who, in your view, are good fathers? Can you give examples? What makes these men good fathers?
 3. What are your goals as a father?
 4. What are your hopes and dreams for your child?
 5. What do you like about being a father?
 6. What do you find difficult about being a father?
 7. What would you need to do or to have in order to be a better father than you are now?
 8. Do you plan to raise your child like your father raised you? In what ways?
Why?

Phenomenology: categories

TABLE 3. *Characteristics of a Good Father*

Characteristic	Selected comments
Availability	"A good father is someone who's there." "You need to be there for both the mother of your baby and the baby." "Being there no matter what happens." "You need to be there for your child everyday." "My mom is both mom and dad. She showed love and was always there, still is." "I'm looking forward to being there." "(To) always be available to your kids."
Financial support	"You need to take care of them financially." "Take care by working, giving the mother money to buy things they need." "Giving them what they need, diapers, clothes, crib, everything." You need to be supportive through goods."
Emotional support	"To be a good father you need to have a big heart." "He shows him love." "Caring and loving, hugging them and all that. Showing affection, not neglecting them." "To love my child."
Teaching	"Teach him right from wrong and teach him to be a good kid." "When she gets of age to let her know right from wrong and let her know it's not gonna be easy, that she'll still have to work hard." "The morals I show him he will pass these morals to his kids."
Assuming responsibility	"My father taught me that to be successful in life you have work for it. I want to teach those values to him." "To be able to take responsibility for being a father. To accept the challenge." "I think the first thing is being responsible. If you were responsible enough to create a baby, you should be responsible enough to take care of it." "Being able to admit and own up to it." "A good father needs to be responsible."

Phenomenology: themes

TABLE 4. *Fatherhood: Goals and Needs*

Goals/needs	Selected comment
Completing education	"Eventually, I would like to finish school and get an education." "I'm trying to complete school right now. That's my main goal." "I plan to go to college and the purpose is for my baby." "I think the better education is the most so I can do better. That's why I'm back in school now."
Employment	"I need to get a good education and a college degree." "To get a job and take care of my son the best I can." "A job, 'cause I've been looking for a job but it's hard when you don't have no experience." "To be able to provide for her, what she needs. Have a job to buy things." "A job or I won't be able to take care of him."
Becoming a role model/changing patterns of behavior	"Get a good job and be able to support my family." "Get my life together. I want to show my son I'm a good person, not a bad person." "Teach him that I can be something, too." "Have her look up to me as a role model." "I need more morals." "Part of the things I need to do to show him a good example, so he don't feel that there's no hope for him." "To not sell drugs anymore." "I would need to stop hanging around with the wrong people."

Grounded theory: article

Developing a Leadership Identity: A Grounded Theory

Susan R. Komives
Felicia C. Mainella

Julie E. Owen
Laura Osteen

Susan D. Longerbeam

This grounded theory study on developing a leadership identity revealed a 6-stage developmental process. The thirteen diverse students in this study described their leadership identity as moving from a leader-centric view to one that embraced leadership as a collaborative, relational process. Developing a leadership identity was connected to the categories of developmental influences, developing self, group influences, students' changing view of self with others, and students' broadening view of leadership. A conceptual model illustrating the grounded theory of developing a leadership identity is presented.

Rosen (1978) observed that despite the large

The Scholarship of Leadership

Rost (1993) concluded that most of what has been labeled leadership in the past was essentially good management. Leadership theories that rely on traits, behaviors, and situations to explain leadership worked well in an industrial era when the predominant goals of leadership were production and efficiency. However, Rost and other scholars (Allen & Cherrey, 2000; Bennis, 1989; Heifetz, 1994; Wheatley, 1999) noted that society has shifted to a knowledge-based, networked world. Rapid advancements in technology, increasing globalization, com-

Grounded theory: procedures

Procedures

Sampling. The study employed the purposeful sampling procedures of intensity sampling to identify "intensity-rich cases that manifest the phenomenon intensely, but not extremely" (Patton, 2002, p. 243). Nominators in professional positions that afforded them the opportunity to observe students interacting in group settings at a large mid-Atlantic research university were invited to nominate students who were exemplars of relational leadership.

Participants. From the pool of possible participants, we invited 13 students who exhibited the theoretical dimensions of relational leadership to participate in the study. Eight of the participants were White, 1 was Asian American, 3 were African American, and 1 student was African who immigrated to the United States as a child. Eight of the participants were men and 5 were women. There were 2 sophomores, 9 fourth- or fifth-year seniors, and 2 recent graduates. Two participants identified themselves as gay men; others identified themselves as heterosexual or did not identify their sexual orientation. The group was religiously diverse including Muslim, Bahá'í, Jewish, and Christian students, as well as those without active religious affiliations. There was a range of majors from chemistry to speech communications. Students used their

In-Depth Interviews. Each student participated in a series of three interviews with the same interviewer. A research team of five White women conducted the research. A structured interview protocol was designed to ensure continuity across interviewers. After participants gave written informed consent, interviews were tape-recorded and subsequently transcribed. Through constant comparative analysis (Merriam & Associates, 2002; Strauss & Corbin, 1998), the research team modified questions to explore emergent issues. Researchers maintained field notes during each interview.

The three interviews ranged from 1 to 2 hours each. This "three-interview series" followed Seidman's (1991) model focusing on life history, followed by a detailed exploration of the experience, and lastly focusing on "reflection on the meaning" (p. 12). The first interview used a life narrative method (Bruner, 1987; Riessman, 1993) and asked the student to start back in elementary school and reflect on "how you have become the person you are now." This question allowed for the broadest possible story to emerge so researchers could connect various experiences to the emergence of leadership identity. The purpose of the second interview was to identify the students' experiences working with others and to explore their experiences with leadership. The third interview explored how the students' view of leadership changed over time and what influenced that changing view.

Grounded theory: explanatory model

Data Analysis

We used open, axial, and selective coding (Strauss & Corbin, 1998) to analyze the data. During open coding, each transcript was analyzed in sentences or groups of sentences reflecting single ideas. These units were given a code to reflect that idea or concept (Strauss & Corbin). The open coding identified 5,922 items that were combined through axial coding into 245 abstract concepts. In selective coding the concepts were ultimately organized into one central category or "what the research is all about" (p. 146), in this case, leadership identity along with five categories: (a) essential developmental influences; (b) developing self; (c) group influences; (d) changing view of self with others; and (e) broadening view of leadership. Properties—also known as attributes of a category—were identified for each of these categories. Strauss and Corbin clarified that "whereas properties are the general or specific characteristics or attributes of a category, dimensions represent the location of a property along a continuum or range" (p. 117). Through constant comparative analysis (Merriam & Associates, 2002; Strauss & Corbin), each participant's response was compared and connected to others as categories, properties, and dimensions emerged.

Affective investments in the Manila region: Filipina migrants in rural Japan and transnational urban development in the Philippines

Lieba Faier

Over the past few decades, remittances from overseas migrant labourers have come to play an important role in fuelling demand for new residential developments in countries like the Philippines. This paper draws attention to how financial flows enabling this urban development are tied to transnational migrants' experiences abroad. Drawing on more than 2 years of ethnographic fieldwork in Japan and the Philippines, it considers how, why and to what ends some Filipina wives of Japanese men in rural Nagano, Japan, aspire to build houses in the Manila region, and it explores how these real estate investments are linked to the affective processes through which these women transnationally craft lives and selves. Approaching affect as a site of subject-making, this essay suggests these houses are best understood as 'affective investments' that are shaped not only by capitalist practices and state policies, but also by the discourses of hope, frustration, shame, fear, desire and longing through which these women make sense of their transnational lives. The paper thereby illustrates how affect and political economics can intertwine in migrants' investment decisions and, thus, the transnational role affect can play in articulating hegemonic urban development plans.

Key words urban space; migration; affect; houses; Philippines; rural Japan

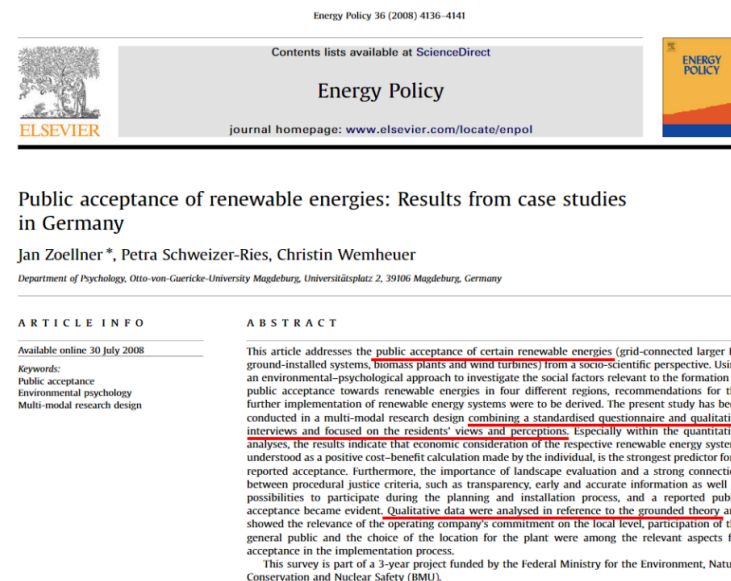

Related reading: anthropology of public policy

Toward an Anthropology of Public Policy

As the rational choice model of “policy” proliferates in “policy studies,” the social sciences, modern governments, organizations, and everyday life, a number of anthropologists are beginning to develop a body of work in the anthropology of public policy that critiques the assumptions of “policy” as a legal-rational way of getting things done. While de-masking the framing of public policy questions, an anthropological approach attempts to uncover the constellations of actors, activities, and influences that shape policy decisions, their implementation, and their results. In a rapidly changing world, anthropologists’ empirical and ethnographic methods can show how policies actively create new categories of individuals to be governed. They also suggest that the long-established frameworks of “state” and “private,” “local” or “national” and “global,” “macro” and “micro,” “top down” and “bottom up,” and “centralized” and “decentralized” not only fail to capture current dynamics in the world but actually obfuscate the understanding of many policy processes.

Case study: article

Case study: research purpose

1. Introduction

Regarding the CO₂ reduction goals set by international politics, an increasing usage of renewable energies and a necessary shift of our existing energy systems towards sustainability have been discussed widely. In Germany, power generation via renewable energies has been strongly supported by the German government during the last few years. As a result, the number of renewable energy systems in power generation has risen rapidly. For reaching the goals in CO₂ reduction, an even higher degree of utilisation is required. So far, this topic has mostly been assessed from a technical point of view. Consequently, discussions focused on questions such as the reliability of energy supply or the challenges of grid integration.

Besides technical, legal and economic questions, however, broad public acceptance and a corresponding transfer of consciousness into every-day life are essential for reaching the reduction goals. Therefore, the present approach aims at investi-

gating the social processes connected with renewable energies. Despite the fact that representative public opinion polls show considerable support for sustainable energy policies as well as for a growing percentage of renewable energies in power generation on an abstract level, many residents on the local level feel severely limited in their quality of life by renewable technology systems installed nearby, i.e., for instance, by undesired changes of the landscape, by noise or by transport issues. In addition, risks for nature such as potential birdstrikes are perceived critically. In addition to these rather obvious aspects, contextual framework issues such as rising energy costs due to the mandated inclusion of increasingly larger percentages of renewable energies within the energy supply, the handling of administrative zoning, planning and licensing procedures as well as the provision of early and accurate information in specific implementation processes might influence how people think of renewable energy plants.

Taken together, these points emphasise the importance of knowing the social factors relevant to the formation of public acceptance towards renewable energies. In the same vein, it is necessary to investigate the corresponding processes on the

Case study: methodology

Research in environmental psychology follows the principles of transdisciplinarity, multi-methodology and application-orientedness in order to address the complexity of the phenomena under investigation (Bell et al., 2001). Therefore, a multi-methodological approach is used to study the present subject. According to Bortz and Döring (1995), qualitative methods are to be used when (1) verbal data are to be interpreted and the subject under study has been poorly investigated so far, or when (2) the specific individual perspective of the research subjects is focussed upon. In addition, the described project aspires to actively involve the investigated individuals as opposed to view them as research objects only. It is planned, therefore, to reflect and discuss the project results in order to facilitate renewable energy processes in the communities.

3.1. Description of the investigated regions

All in all, four different regions have been researched. Two regions were compared concerning the social aspects of the implementation processes of PV ground-installed systems. In one of the communities, a PV system was installed (A), while in the other community (B) several hindrances prevented the installation of the planned PV ground-installed system. Region A is situated in a former mining area in East Germany, with all the ecological, economic and social impacts of this industrial background. Region B is situated in South-West Germany. Both communities consist of aggregations of several smaller communities.

As regards both wind energy (C) and biomass (D), one region was surveyed in each case. Region C is located in West-Germany and home to numerous wind turbines. Region D is situated in North-East-Germany, a rural area where many farmers changed their cultivation practices from food plants to energy plants. While many biomass plants are already operating, there is also still considerable protest among residents.

Furthermore, by the end of the research project, eight regions will be studied which gives the possibility to make comparative considerations between the regions and the respective energy technologies in more detail.

Case study: conclusion

6. Conclusion

All in all, the study shows that there is, as a matter of principle, general support of renewable energies in the public. However, for reaching a further expansion of renewable energies utilisation, an increasing support of the concrete energy systems on the local level is needed. In order to reach this "local" acceptance, the described influencing factors and specific regional distinctions and needs have to be considered. In this context, the authors are aware of the fact that from these four case studies representative perceptions cannot be drawn, however, the results of case studies are valuable for sensitising to social processes in further renewable energy utilisation as well as for showing tendencies of what has to be considered in future planning processes. In this regard, two areas seemed to be of particularly importance: the economic estimation and the involvement of residents into the decision making and planning process.

The consideration of these two issues as well as whose combination, e.g., by practical financial involvement concepts on community level, also in connection with other approaches like for instance the willingness-to-pay-variable, are perspectivevely interesting and important fields of research.

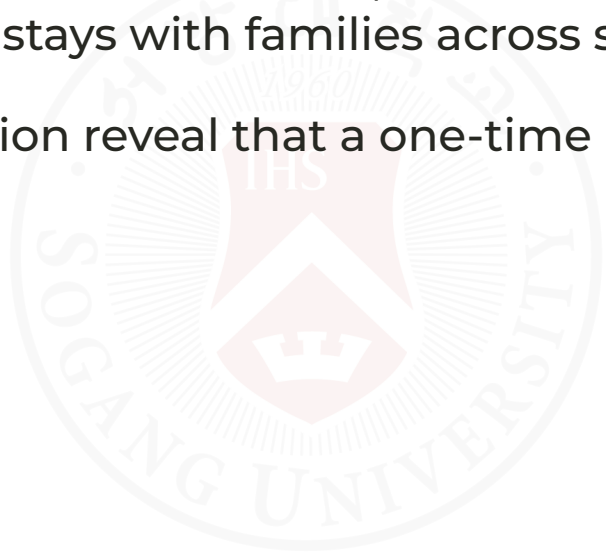

Concluding should be emphasized that in terms of the intended large-scale utilisation of renewable energies an integrated strategy is required. Human, technological and environmental aspects and

Ethnography: why these methods fit

The original example connects migrants' experiences in Japan with house-building in the Philippines.

The supplied excerpt describes extended fieldwork, formal interviews, informal conversations, home visits, social gatherings, and stays with families across settings.

Discuss: What could this combination reveal that a one-time interview might miss?

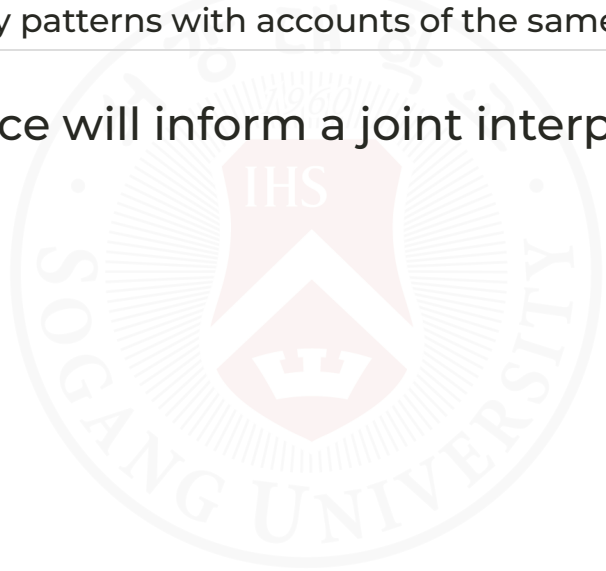

Reference figures and cautions

Week 6 reference: mixed-methods integration

Sequence	Example
Qualitative first	Interviews inform a survey's categories
Quantitative first	Interviews investigate an unexpected survey pattern
In parallel	Compare survey patterns with accounts of the same issue

Explain **where and how** the evidence will inform a joint interpretation.

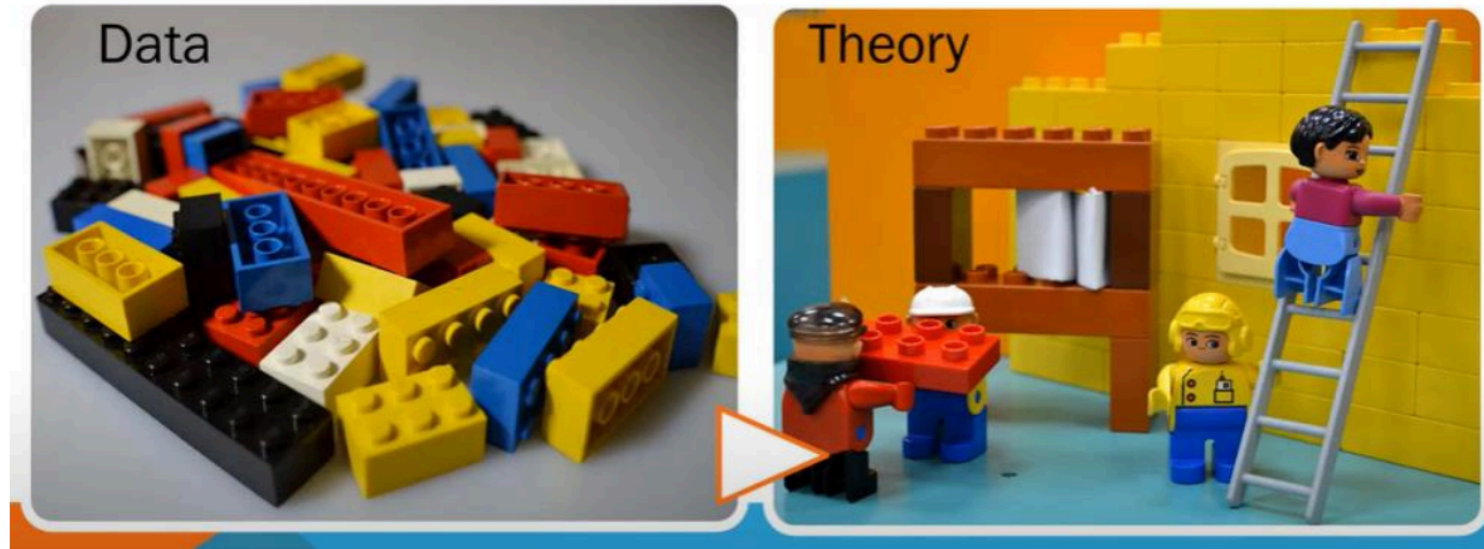

Functions of qualitative research

Box 2.1

STUDY OF HOMELESSNESS: CONTRIBUTIONS OF QUALITATIVE AND QUANTITATIVE METHODS TO DIFFERENT RESEARCH FUNCTIONS

Functions of research	Qualitative research	Quantitative research
Contextual	The nature of different forms of homelessness. The experience/meaning of being homeless.	The extent to which different forms of homelessness exist. The characteristics of homeless people.
Explanatory	The events leading to homelessness/circumstances in which it occurs. Why homelessness continues.	Factors statistically associated with homelessness. Characteristics/circumstances that correlate with different lengths of homelessness.
Evaluative	Appraisal of any interventions experienced. Formative factors in bringing periods of homelessness to an end.	Extent to which different forms of homelessness services are used. Extent to which interventions achieve required outcomes.
Generative	Suggestions/strategies for supporting homeless people/helping people to avoid homelessness.	Prediction of future levels of homelessness. Levels of requirement for different forms of provision/intervention.

Grounded theory: illustration

Coding: a preview of Week 6

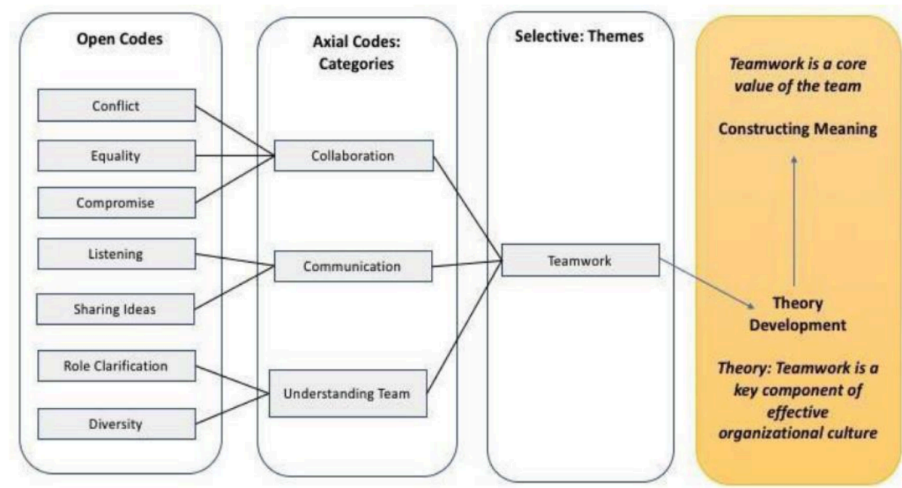

Figure 7. Creation of Theory and Meaning

Approaches and data collection

Method	Focus	Sample size	Data collection
Narrative	Individual experience & sequence	1+	Interviews & other qualitative data
Phenomenological	People who have experienced a phenomenon	5-25	Interviews (documents, observations, and art may be considered.)
Grounded theory	Develop a theory grounded in field data	20-60	Interviews.
Ethnography	Context or culture	Culture-sharing group	Observation & interviews (& other sources in the field).
Case study	Organization, entity, individual or event		Multiple sources: Interviews, documents, reports, observations..

Sample-size ranges in this original figure are illustrative, not course requirements.

Approaches and analysis

Method	Strategies of data analysis
Narrative	Analyzing data for stories, "restorying" stories, and developing themes, often using a chronology.
Phenomenological	Analyzing data for significant statements, meaning units, textual and structural description, and description of the "essence".
Grounded theory	Analyzing data through open coding, axial coding, and selective coding.
Ethnography	Analyzing data through description of the culture-sharing group and themes about the group.
Case study	Analyzing data through description of the case and themes of the case as well as cross-case themes.

Challenges: narrative and phenomenology

Narrative:

- Extensive information about the participant is needed
- Researcher needs to have a clear understanding of the context of the individual's life.
- Need to uncover key source material that captures the individual's experiences and explains the multi-layered context of their life.

Phenomenological:

- Choosing individuals for the study who have all experienced the phenomenon so that a common understanding can be forged.
- Bracketing personal experiences:
 - Researchers must decide how their personal experiences are introduced into the study.

Bracketing and reflexivity vary across traditions; researcher influence cannot be eliminated.

Challenges: grounded theory and ethnography

Grounded theory:

- The researcher needs to set aside theoretical ideas or notions so that the substantive theory can emerge.
- The researcher may have difficulty in determining when categories are saturated or when theory is sufficiently detailed.

Ethnography:

- Deep expertise is required.
- Sensitivity.
- Access.
- Duration and cost.
- Bias.

Use of prior theory and saturation varies across qualitative traditions.

Challenges: case study

Case study:

- Identifying cases to study.
- Identifying whether a single case or multiple cases are needed.
- Selecting an appropriate purposeful sampling strategy.
- Having access to multiple sources of data.
- Deciding how the boundaries of a case might be constrained by time, events, or processes.
